AI-GENERATED SUMMARY

Group 7 CW1 – Treasure Planet Ship Design

Student: Tabitha Kajendran **Student ID:** w2177362

Summary of AI use

During this coursework, I used ChatGPT as a source of guidance when I needed suggestions or clarification during the development of my individual contribution. My use of AI was limited and mainly focused on getting ideas and advice rather than completing the work for me. One example was asking ChatGPT for suggestions on suitable colours for my Treasure Planet-inspired ship model. I wanted the ship to have a consistent appearance that matched the theme of the project. ChatGPT provided suggestions for possible colour combinations, which helped me consider different design ideas. I ultimately decided to use royal blue, gold and white for my ship because I felt these colours worked well together and suited the appearance I wanted. I also used ChatGPT for occasional guidance when I needed help understanding aspects of the coursework and organising my individual report. I asked for feedback on my own writing so I could identify areas that needed improvement and understand how to make my explanations clearer. The actual ship customisation was completed independently by me using Mecabricks. This included changing the colours of the ship, customising the front deck, keeping the sails white and removing the black skull decoration from one of the sails. ChatGPT did not create, edit or modify the 3D model. Overall, AI was used as a supporting tool to provide suggestions, guidance and feedback. I considered the suggestions provided but made my own decisions throughout the design process. The final ship design and the practical work completed in Mecabricks were my own contributions to the group project.
