Individual Report

Below shows all the following work I've contributed to this Coursework.

Unity Build – Scene Creation, Scripts, Assets

Scene Creation

Within the Images above it shows the Sample Scene I've formed using the assets the group had made for the Project, I have made everything myself, aside from everything on the ship (Aside from the Ship Captain) and the amazing artwork made for the menu screen.

Scripts

I have created all scripts used within the project; these scripts are:

Free-Roam Camera: Camera can move around the 3D Environment using WSAD + Mouse Controls.

CanvasTextToggles: Hides and Shows Canva Text (TMP) on button press (U)

CameraWaypoint: Used to Teleport Camera to various positioned Empty Game Objects on Map.

CameraWaypointManager: Placed on Camera to link with the Empty Game Objects to perform the Teleportation to the various locations on the Map.

EnterObservatory: Script put on a game object, so when the mouse clicks it sends the user to the second scene which is the main area of the Game from the Main Menu.

ExitObservatory: Script put on a game object, so when mouse clicks it the Game closes.

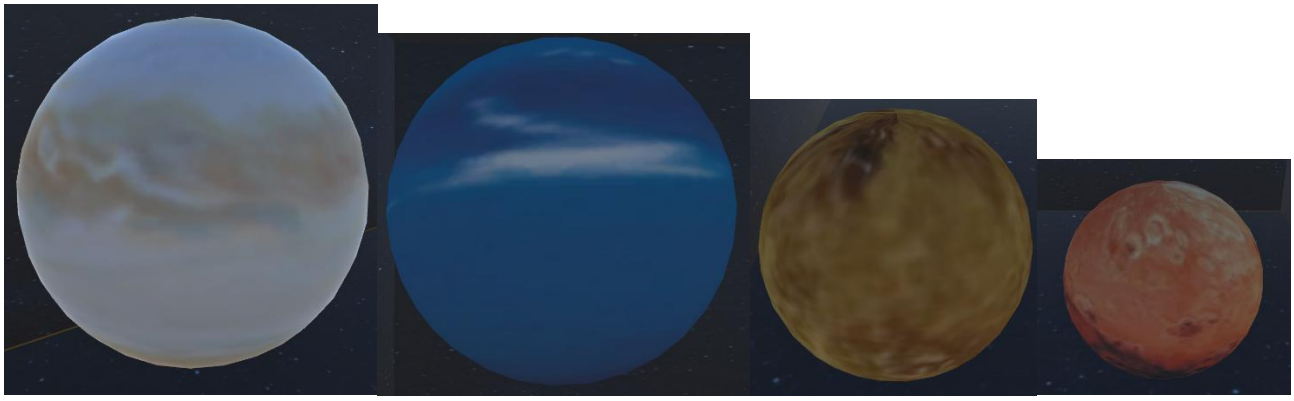

BacktoMenu: Script for button press (Alpha0) the User goes back to the first scene of the Game, which is the Main Menu.

HelpLog: Script put on a game object, so when the mouse clicks it sends the user to the third scene which is the Help Log screen.

Assets

Below are all the Assets I've personally contributed to the Project.

Planets

Ship Captain

Space Walls

Animations

Below shows all the animations Ive contributed to making on the project with a description of the animation step by step below.

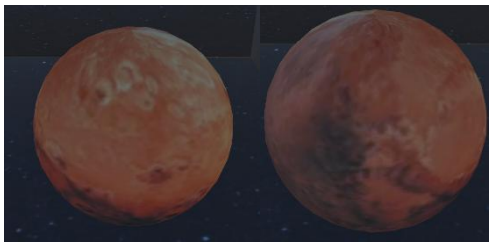

Ship Captain – Lego Figure

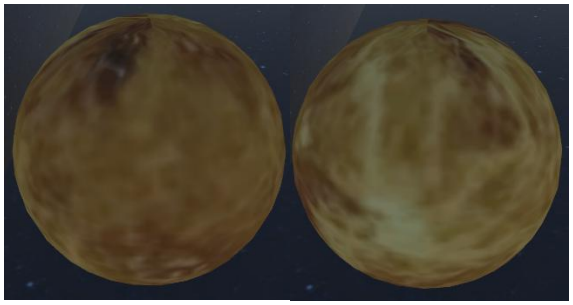

As you can see in the screenshots above, the ship's captain has 3 unique positions he takes during hit animation. He starts in his initial position, holding the steering wheel straight, legs firm on the ground. The second position is him rotating to the right, as he does so his peg-leg stays on the ground as his left leg lifts off the ground, then returns to position 1. The third position is him rotating in the opposite direction but then has his left leg on the ground instead of his peg-leg, which is then in the air to show him gaining stability whilst steering the ship.

Planets – Unity Objects

Mars

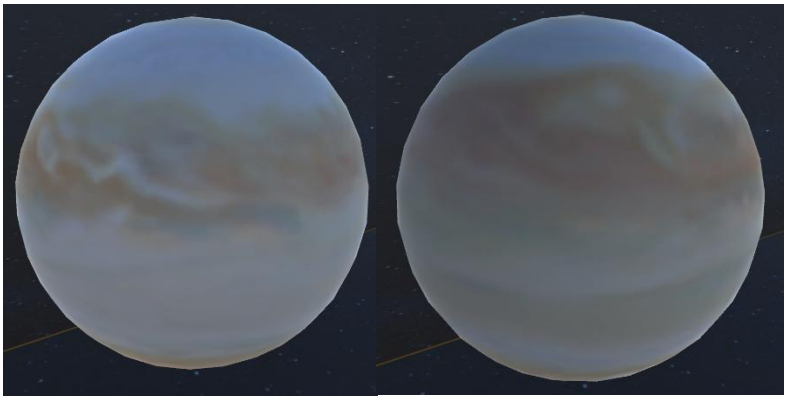

Venus

Neptune

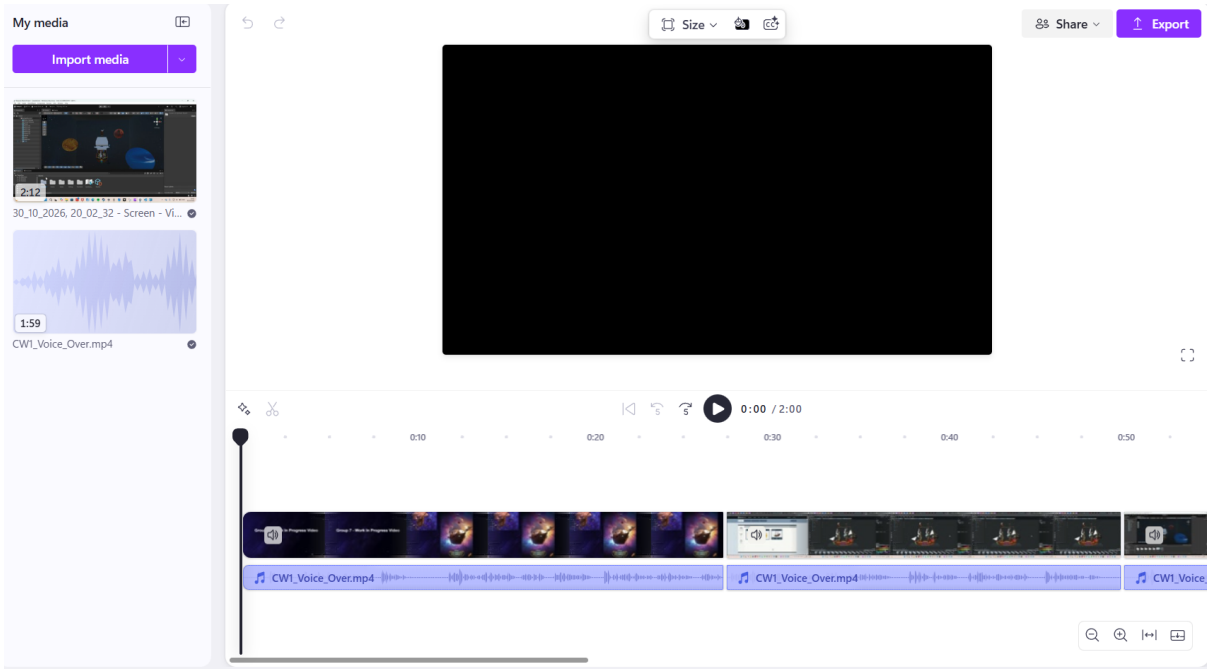

Jupiter

As you can see all the planets rotate constantly, unique features to note with each of the Planets is that they all rotate at different speeds based on their real-life rotation speeds.

Work in Progress (WIP) Video

I made 100% of the contribution to the development of the Work In Progress video made by the Group.

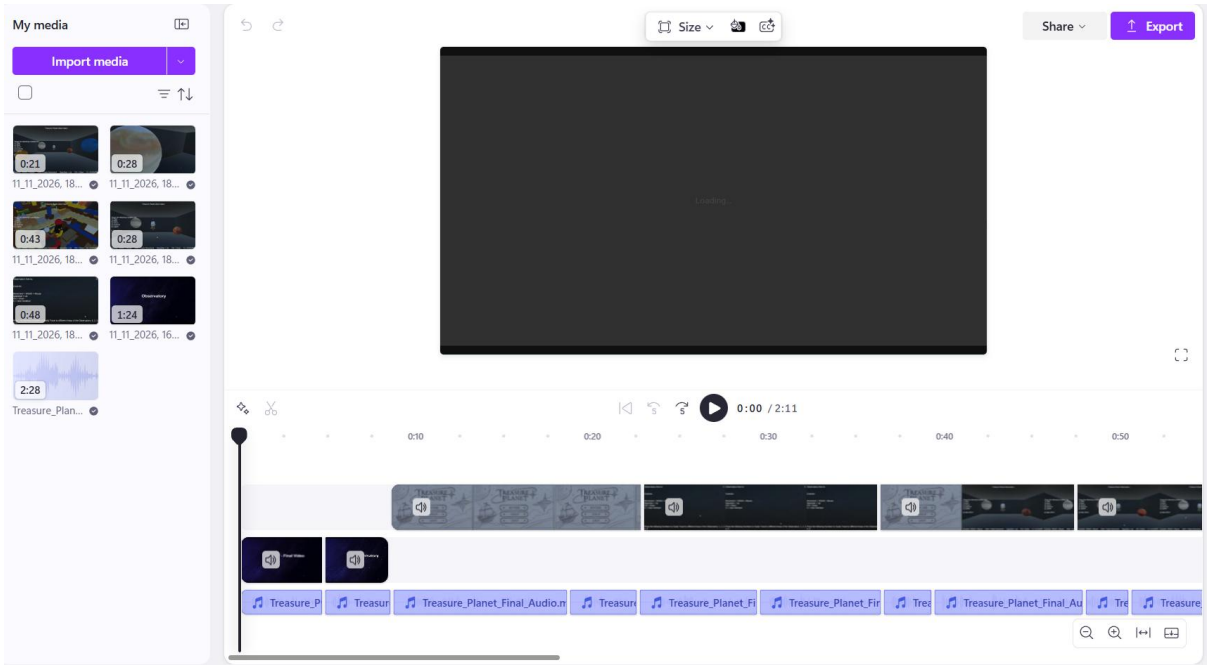

I did all the screen recording for the video on Clipchamp and added a voiceover I did over my Phone to go along with the footage.

Final Video

I made 100% of the contribution to the development of the Final video made by the Group.

I did all the screen recording for the video on Clipchamp and added a voiceover I did over my Phone to go along with the footage.
